- 7 Knowledge Transfer

This set of slides was produced to give an overview of different digital tools, used in our final project.

In general, we got experience with Git/Github, Slack, R, Python, SQL, LaTeX (Overleaf and Sublime Text editor) to elaborate the project.

Version control was implemented with Git. The commands were sent via command line and GitHub desktop.

We collaborated on the project, using Git.

Also we created a Slack channel and connected it to our Git repository.

We configured Sublime Text editor to use LaTeX.

- Using Sublime Text and Overleaf, we produced this set of slides as a beamer presentation.
- Using Sublime Text and Overleaf, we produced the report (report.tex), that contains a table of contents, figures, tables and bibliography.
- We elaborated the bibliography, having created an auxiliary file /text/biblio.bib.

For our project we performed a set of calculations in R (`/code/wacc.R`). Specifically we calculated the cost of capital of oil companies with the following steps:

- Downloaded .csv files with stock and index data
- Processed and filtered the data in R, using SQL
- Used regression analysis to estimate historical betas
- Produced LaTeX output in R
- Built plots in R
- Assembled the findings in LaTeX

Knowledge transfer

With the means of R shiny we produced an interactive page, that processes user's input into graphs (/r-shiny/app.R).

The application allows user to choose one of the companies and time interval to visualize stock dynamics on a graph. The user may also choose an option to see the dynamics of S&P 500 on the same graph.

Plot stock price of:

Choose company:

China Petroleum & Chemical

▼

☐ S&P 500

Choose interval:

2015-01-01

to

2020-11-30

Knowledge transfer

Example of output:

Min	38.20
Max	105.50
Mean	71.29
Median	73.38
